本项目选用 wms 系统的货品查询功能,包括查询货品列表和货品价格等。项目结构如下图所示:

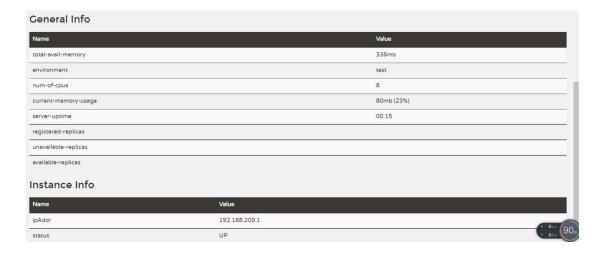

一、创建 SpringCloud 项目

1. eureka 配置成功 (提供注册服务)

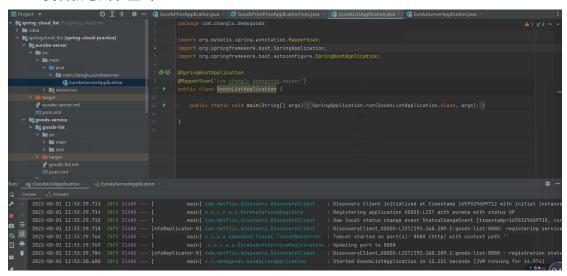

2. 进入 eureka 管理界面

二、客户端 client 配置

- 1. 客户端 client 配置成功
- (1) 货物信息列表查询

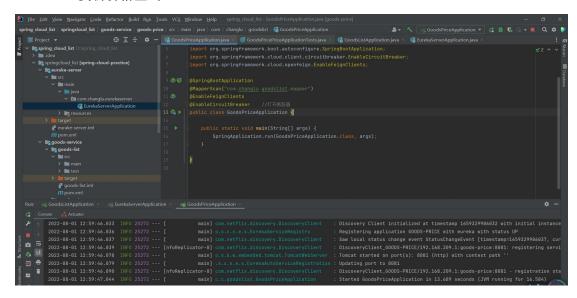

当再次进入服务注册页面时,可见服务提供者已被注册进服务注册者

DS Replicas

Instances currently registered with Eureka

Application	AMIs	Availability Zones	Status
GOODS-LIST	n/a (1)	(1)	UP (1) - LAPTOP-IANDTOQJ:goods-list:8082

(2) 货物价格查询

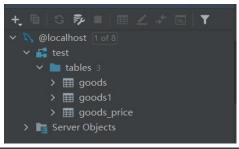

当再次进入服务注册页面时,同理可见可见服务提供者已被注册进服务注册者

DS Replicas Instances currently registered with Eureka Application AMIs Availability Zones Status GOODS-LIST n/a (1) (1) UP (1) - LAPTOP-IANDTOQJ:goods-list:8082 GOODS-PRICE n/a (1) (1) UP (1) - LAPTOP-IANDTOQJ:goods-price:8081

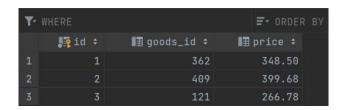

三、创建数据库(Mysql)

1. 在 MySQL 中创建数据库,包括三个表,分别为货物列表、货物有效标识表和货物价格列表。

四、Mybatis 使用

如在 mapper 文件中引入 mybatisplus 包中的基类

```
jimport com.baomidou.mybatisplus.core.mapper.BaseMapper;
import com.changlu.goodslist.pojo.GoodsPrice;
import org.apache.ibatis.annotations.Select;
import com.changlu.goodslist.pojo.Goods1;
```

并在继承基类的基础上构造所需的 mapper 文件

```
public interface GoodsPriceMapper extends BaseMapper<GoodsPrice> {
     @Select("select * from goods1")
     List<Goods1> getGoods1List();
}
```

五、运行测试项目

1. 先运行 Eureka 服务的启动类,然后运行货物信息查询功能(GoodsListApplication)的启动类,其中货物信息模块的 yml 文件中该服务提供方的 port 端口号设置为 8082

```
pspring:
datasource:
    driver-class-name: com.mysql.cj.jdbc.Driver
    url: jdbc:mysql://localhost:3306/test?useSSL=false
    username: root
    password: ab123456
    application:
    name: goods-list # 应用名
```

在浏览器中输入 url: https://localhost:8082/goods/list可得如下运行界面:

2.启动 Eureka 服务的启动类后,再启动货物价格查询功能(GoodsPriceApplication)的启动类,其中货物价格信息模块的 yml 文件中该服务提供方的 port 端口号设置为 8081

```
spring:
datasource:
driver-class-name: com.mysql.cj.jdbc.Driver
url: jdbc:mysql://localhost:3306/test?useSSL=false
Username: root
password: ab123456
application:
name: goods-price # 应用名
server:
port: 8081
```

在浏览器中输入 url: https://localhost:8081/goods/list 可得如下运行界面:

六、Feign 远程服务

在 goodsprice 模块的客户端(client)包中,创建了接口类 GoodsListClient 及其实现类。

在接口类 GoodsListClient 中,通过直接远程调用 goodsList 模块的 getList()方法,可以直接实现 GoodsListClient 类,不必再通过继承接口人工实现了。

```
@FeignClient(value = "goods-list",fallback = GoodsListClientHystrix.class)
@@Primary
public interface GoodsListClient {

    @GetMapping("/goods/list")
    List<Goods1> getList();
}
```

七、SpringCloud 项目打成 Jar 包

利用 maven 中的 clean 和 package 组件,将该项目的各个模块打成 jar 包存放在 target 文件夹中,方便后面进行部署。

eurake-server-1.0.0.jar	2022/8/2 13:59	Executable Jar File	46,498 KB
	2022/8/2 13:59	Executable Jar File	48,008 KB
	2022/8/2 13:59	Executable Jar File	51,239 KB

八、利用 Docker 部署项目

在 vmvare 虚拟机中的 ubuntu 环境中安装 docker 并进行部署。 创建 Dockerfile 文件:

Dockerfile_list	2022/8/2 14:14	文件	1 KB
Dockerfile_price	2022/8/2 14:19	文件	1 KB
Dockerfile_server	2022/8/2 14:19	文件	1 KB

在 ubuntu 中利用 docker 命令创建镜像:

```
root@ubuntu:/tmp/springcloud# docker build -t server -f Dockerfile_server .

Sending build context to Docker daemon 149.2MB

Step 1/5 : FROM java:8
---> d23bdf5b1b1b

Step 2/5 : VOLUME /tmp
---> Using cache
---> d8bb3f8d2698

Step 3/5 : ADD eurake-server-1.0.0.jar /tmp/springcloud
---> 9650bcf04adf

Step 4/5 : EXPOSE 8000
---> Running in 9d7c5528b21d

Removing intermediate container 9d7c5528b21d
---> 8c396dcfa207

Step 5/5 : ENTRYPOINT ["java","-Djava.security.egd=file:/dev/./urandom","-jar","
/boot.jar"]
---> Running in f1b49bb325b3
Removing intermediate container f1b49bb325b3
---> 95ca99124413
Successfully built 95ca99124413
Successfully tagged server:latest
```

```
root@ubuntu:/tmp/springcloud# docker build -t list -f Dockerfile_list .

Sending build context to Docker daemon 149.2MB

Step 1/5 : FROM java:8
---> d23bdf5b1b1b

Step 2/5 : VOLUME /tmp
---> Using cache
---> d8bb3f8d2698

Step 3/5 : ADD goods-list-1.0.0.jar /tpm/springcloud
---> 50e8fdb721e3

Step 4/5 : EXPOSE 8082
---> Running in 98c92097d7ea

Removing intermediate container 98c92097d7ea
---> 180d7602bd26

Step 5/5 : ENTRYPOINT ["java","-Djava.security.egd=file:/dev/./urandom","-jar","
/boot.jar"]
---> Running in f93ab529cf98

Removing intermediate container f93ab529cf98
---> 7fcb6131bba5

Successfully built 7fcb6131bba5

Successfully tagged list:latest
```

```
root@ubuntu:/tmp/springcloud# docker build -t price -f Dockerfile_price .

Sending build context to Docker daemon 149.2MB

Step 1/5 : FROM java:8
---> d23bdf5b1b1b

Step 2/5 : VOLUME /tmp
---> Using cache
---> d8bb3f8d2698

Step 3/5 : ADD goods-price-1.0.0.jar /tpm/springcloud
---> f9ce9d7d9e5b

Step 4/5 : EXPOSE 8081
---> Running in 7502d59c61b9

Removing intermediate container 7502d59c61b9
---> 8bb41c0d6052

Step 5/5 : ENTRYPOINT ["java","-Djava.security.egd=file:/dev/./urandom","-jar","
/boot.jar"]
---> Running in 86ff0893483a

Removing intermediate container 86ff0893483a
---> 88c24cb4058f

Successfully built 88c24cb4058f

Successfully tagged price:latest
```

查看镜像列表:

```
root@ubuntu:/tmp/springcloud# docker
                                       image ls
REPOSITORY
               TAG
                          IMAGE ID
                                          CREATED
                                                           SIZE
                                          2 hours ago
               latest
                         88c24cb4058f
                                                           696MB
price
list
                          7fcb6131bba5
                                          2
               latest
                                            hours ago
                                                           692MB
                         95ca99124413
                                          2 hours ago
                                                           691MB

java
               8
                                          5 years ago
                                                           643MB
```

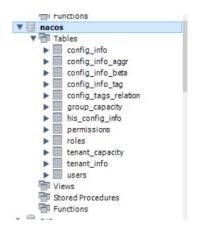

Docker 命令运行容器,并查询容器

```
oot@ubuntu:/tmp/springcloud# docker run -p 8000:8000 -itd --name cserver2 --pri-
vileged=true server /bin/bash
a60806f87191180cdc2a50fa7cf8639189f4e52af5794a61683e973b16f8a120
root@ubuntu:/tmp/springcloud# docker ps -a
                 IMAGE
                                                             CREATED
                                                                                STATUS
CONTAINER ID
                                COMMAND
                     PORTS
                                NAMES
                                 'java -Djava.securit..."
a60806f87191
                                                             14 seconds ago
                                                                                Exited (1
                server
) 10 seconds ago
                                cserver2
                                "java -Djava.securit..."
                                                                                Exited (1
eacb85cbfc6c
                                                             7 minutes ago
                server
```

九、nacos 配置

1. 创建 nacos 数据库,并运行 conf 文件下的 nacos-msql 文件

2. 启动 nacos

2022-08-02 18:44:02,103 INFO Nacos is starting...
2022-08-02 18:44:03,114 INFO Nacos is starting...
2022-08-02 18:44:03,567 INFO Nacos Log files: D:\nacos\nacos-server-1.4.0\nacos\logs
2022-08-02 18:44:03,568 INFO Nacos Log files: D:\nacos\nacos-server-1.4.0\nacos\conf
2022-08-02 18:44:03,574 INFO Nacos Log files: D:\nacos\nacos-server-1.4.0\nacos\data
2022-08-02 18:44:03,575 INFO Nacos started successfully in cluster mode. use external storage

3. 通过本地网址访问 nacos

NACOS. an easy-to-use dynamic service discovery,	登录	
configuration and service management platform for building cloud native applications	root
